Now we want to talk about limits more carefully; this will include some dx of our first steps towards our goal of being able to differentiate every function you know Some limits are easy to compute:  $\lim_{x \rightarrow 3} (x^2 + 2x + 3) = 12$   $\lim_{x \rightarrow 3} (x + 1) = 4$  With an easy limit, you can get a meaningful answer just by plugging in the limiting value

Topics: LB 119 is an introduction to the methods of integral calculus, infinite series, and vector operations. The central theme is to apply the concept of a limiting value to the study of functions of a single real variable. You will already be familiar with this method as used to define the derivative of functions of a single real variable.
