Problem 27 Let $G = \{x_i\}$ be the set of global minimums of our function $f(x)$. Then this means that $f(x_i) \leq f(x)$, for all x and each $x_i \in G$. In that relationship take $x = x_j \in G$ for $j \neq i$ and conclude that $f(x_i) \leq f(x_j)$. We could do the same thing with i and j switched to show that $f(x_j) \leq f(x_i)$. This means that $f(x_i) = f(x_j)$ and thus all global minimums must have the same function value.

Optimization Intro - University of Wisconsin-Madison

Numerical linear algebra plays a central role in numerical optimization. Subproblems in optimization algorithms are frequently numerical linear algebra problems. Need to solve efficiently { exploit structure. Also, the linear algebra problems at adjacent iterations of the optimization algorithm may be closely related, especially in the simplex method.
